Personal Computer
Information Security Conference
Summary

(9-10 May)

The purpose of the conference is to focus increased attention on the need
and the means for protecting information that is processed by personal
computers (PCs), both standalone and networked. We expect that a sharper
focus on information security will be translated into enhanced security
practices throughout the Community. Conference objectives are twofold: (1)
To provide a perspective on Intelligence Community PC information security
policy, and (2) to increase awareness about current technical developments
that can be applied to enhance information security. Attendance is by
invitation only, to both government and private industry personnel.

The first day will be devoted to government presentations and discussions
relating to current policies, Community activities, Community goals, and
security issues related to implementation of stronger security practices with
off-the-shelf technologies. Both government and private industry personnel
are welcome at these presentations. Additionally, representative
off-the-shelf PC security products will be demonstrated after lunch and at the
end of the conference day.

The second day will be devoted primarily to industry presentations of
current capabilities and techniques addressing PC security. A government only
session will also be held toward the end of the day to summarize government
perspectives. Representative off-the-shelf PC security products will again be
demonstrated after lunch and at the end of the conference day.
